

1st of September -A new titanium dioxide for the coating industry in the nordic.

Univar in Nordic launches a new micronised rutile pigments produced for the decorative and industrial coating applications.

This is a high quality range of Sulphate Route Titanium Dioxide grades produced within the EU. These products have been supplied to the European Market for many years with great success.

EUT 502 is a very good multi-purpose grade which can be used for most decorative or industrial coatings.

EUT 503 can be offered as an alternative if 502 does not meet the required gloss levels in difficult systems.

EUT 501 is lower in durability than the other two grades and can be used for matt dispersion paints and interior powder coatings.
